EA claim: "an incident...led to...fission products" (gamma emitters)

In pond in 1969: 1 fission atom ≈ 1 plutonium atom ≈ 500 uranium atoms

Such a massive fission product peak that leak doesn't affect amount left in pond & gammas in leak decay exponentially. Not just "an incident"

MAFF 67-95: no gamma data 66-68
NRPB: large peak

1982, larger plutonium peak but no gamma peak
2001, EA prosecuted Magnox for "poor maintenance of...filters"

Westminster stopped plutonium testing?

- 1969 in pond large gamma peak meant large plutonium peak
- 2018 low gamma signal does NOT mean low plutonium in mud
